## CV1000 Fuel Pump Electrical Circuit Verifier

The CV1000 Circuit Verifier tests the condition of the vehicle fuel pump electrical circuit. It determines if the vehicle electrical system is malfunctioning (and contributing to the no-fuel situation) or if the fuel pump itself is inoperable. The CV1000 will illuminate a red or green LED indicating the results of the test condition.

**INCLUDES**  
these connectors!

Ford

Chrysler

GM

Additional connectors available; contact your NAPA AUTO PARTS store or visit [www.NAPAFuelPumps.com](http://www.NAPAFuelPumps.com)

### Contents include:

- ✓ (1) Circuit Verifier Diagnostic Tool (CV1000)
- ✓ (1) 15-foot attachment cable
- ✓ Application-specific adaptor harnesses
- ✓ (3) AAA batteries (required)

If the circuit shows "FAIL," the cause of the no-fuel issue is most likely not the pump, and requires further investigation.

If it shows "PASS," then the circuit is fine; the pump has failed and needs to be replaced.

## EASY TO USE!

**UNPLUG**

**CONNECT**

**TEST**
